## CANopen Configuration

The CML 7xx light curtains communication is corresponding according the CANopen Profile „DS3101" and „DS401" The communication profil area from index 1000h - 1FFFh contains the CANopen standard parameters.
Product specific parameters starts at index 2000h
Communication specific parameters are automatically persistent. To save product specific settings against power failure, it's necessary to send save command (Index 0x2200)

## Cascading Configuration

To avoid interferences multiple light curtains can be cascaded. The master generates the cyclic trigger signal, the slaves start their scanning after the configured delay time (different delay values required).

| Parameter | Index <br> (Hex.) | $\begin{array}{l}\text { Subindex } \\ \text { (Hex.) }\end{array}$ | Data type | Access | Min.Value | Max. <br> Value | Default | Remark |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Cascading | 2102 | 1 | t08U | RW | 0 | 1 | 0 | 0: inactiv (continuous scanning) <br> 1: activ (sensor waiting for trigger-signal) <br> Notice: In case of working in cascading application, it's necessary to set master on 1 (activ) |
| Function mode | 2102 | 2 | t08U | RW | 0 | 1 | 0 | 0: Slave (waiting for trigger signal) <br> 1: Master (generating trigger signal) |

## Leuze electronic CANopen-Interface

## Measuring Light Curtain CML 720 <br> Object describtion

Appendix A:
Example to read out 64 beams:
Mapping of TPDO1 looks following:

| MAPPINGENTRY1 | $0 \times 24120110$ |  |
| :--- | :--- | :--- |
| MAPPINGENTRY2 | $0 \times 24120210$ | -> mapped is Index 0x2412 SubIndex 01 Length of mapped object is 16bit |
| MAPPINGENTRY3 | $0 \times 24120310$ |  |
| -> mapped is Index 0x2412 SubIndex 02 Length of mapped object is 16bit |  |  |
| MAPPINGENTRY4 | $0 \times 24120410$ | $->$ mapped is Index 0x2412 SubIndex 03 Length of mapped object is 16bit |

Figure 73: Structure of TPDO mapping

It's possible to map per PDO $4 \times 16$ bit objects $\rightarrow 64$ beams
Into the PDO's can be mapped all data which are listed under headline "process data" (Index >2405)

## Leuze electronic CANopen-Interface

## Measuring Light Curtain CML 720

Object describtion

## Appendix B

Example: Activation and deactivation of blanking areas

## Example: Autom. configuration and acivation of 2 blanking areas by teach

How to configure 2 blanking areas by plc:

1) $0 \times 2104$ sub01: to 2 (required number of blanking areas $=2$ blanking areas allowed)
2) $0 x 2104$ sub02: to $1=$ activ (blanking-ares automatically configured by teach)
3) $0 \times 2104$ sub03: to 2 (Logical value 1 for blanked beams)
4) 0x2104sub06: to 2 (Logical value 1 for blanked beams)
5) $0 x 2200$ sub01: value 3 (Teach)

The internal processor calculates the values of objects $0 x 2104$ sub04 and $0 \times 2104$ sub05 as well as $0 x 2104$ sub07 and $0 \times 2104$ sub08 and saves the values remanent. With a successful teach are all other objects $0 \times 2104$ remanent saved, if $0 \times 2103$ sub02 is configured to value $0=$ Save persistent to Flash

## Example: Deactivation of blanking areas

1) $0 x 2104$ sub01: to 0 (No blanking areas allowed)
2) $0 \times 2104$ sub02: to 0 (Autoblanking inactiv)
3) $0 x 2104$ sub03: to 0 (no beams blanked)
4) $0 x 2104$ sub06: to 0 (no beams blanked
5) 0x2200sub01: value 3 (Teach)

To be shure, that all blanking areas are deactivated, it's necessary that at object 0x2104sub1 until sub E all values set to 0 .

Object describtion

## Appendix D: Hole recognition

Example: Hole detection at a web and signalization of a hole at output pin 2
There are different settings at logical functions. Please take care of the still interrupted beams
Configuration of beam width and hole size:

| Index | Describtion / Variables |  |  |
| :---: | :---: | :---: | :---: |
| 2170 | Configuration area 01 |  |  |
| 2170 Sub 1 | Area 01 <br> Value: 1 = Activated | $0 \times 01$ | This area has to be mapped (later on) to output pin 2 |
| 2170 Sub 2 | Logic condition of area <br> Value: 1 = Inverted - dark switching | $0 \times 01$ | Beams are interrupted depending of web width, therefore logical function is dark switching. |
| 2170 Sub 3 | Start beam of area (web) Value:5 | 5 | Beginning at beam no. 5 analysis of hole recognition starts. If it's not shure, that web is always interrupting beam no. 5 , so it will be saver to configure no. 6 or even no. 7 |
| 2170 Sub 4 | End beam of area (web) Value:25 | 25 | Beginning at beam no. 25 analysis of hole recognition ends. If it's not shure, that web is always interrupting beam no. 25 , so it will be saver to configure no. 24 or even no. 23 |
| 2170 Sub 5 | Number of beams for condition ON Value:21 | 21 | With this kind of setting, area /output is switching as soon as $\geq 1$ is not interrupted. |
| 2170 Sub 6 | Number of beams for condition OFF Value:20 | 20 |  |
| Example for detection from $\geq 2$ not interrupted beams |  |  |  |
| 2170 Sub 5 | Number of beams for condition ON Value:20 | 20 | With this kind of setting, area /output is switching as soon as $\geq 2$ is not interrupted. |
| 2170 Sub 6 | Number of beams for condition OFF Value:19 | 19 |  |
| Example for detection from $\geq 3$ not interrupted beams |  |  |  |
| 2170 Sub 5 | Number of beams for condition ON Value:19 | 19 | With this kind of setting, area /output is switching as soon as $\geq 3$ is not interrupted. |
| 2170 Sub 6 | Number of beams for condition OFF Value:18 | 18 |  |
